

The fund's investment objective is to achieve long-term capital growth through the systematic sale of put options. The strategy is based on the volatility premium of options. The volatility premium embedded in option prices reflects investors' risk aversion and tendency to overestimate probabilities of a significant price change. A volatility premium strategy takes advantage of this connection by systematically selling options.

Volatility premia

The volatility premium embedded in option prices reflects investors' risk aversion and tendency to overestimate probabilities of a significant price change.

A volatility premium strategy takes advantage of this context by systematically selling options.

Regular premium income

Every month put options are sold on systematically selected, liquid underlyings with the aim of generating income from unexercised options.

The portfolio's market risk is continuously hedged using index put options in order to reduce losses in the event of sharp market corrections.

Simulated performance

The universe consists of a diversified portfolio of large European and US companies.

Every month put options are sold on systematically selected, liquid underlyings with the aim of generating income from unexercised options.

The portfolio's market risk is continuously hedged using index put options in order to reduce losses in the event of sharp market corrections.

The strategy offers investors a risk-optimized access to an alternative source of income, which is intended to supplement the traditional asset classes by collecting a premia on the options market.

ReCap versus Equities and Bonds

The simulated performance is based on a systematic strategy, minus fees and expected transaction costs. This is for general information only and should not be used as a basis for specific investment decisions. Every prediction or forecast is fraught with uncertainty and cannot necessarily be extrapolated into the future. Data from December 2007 to December 2022.

The strategy maintains a diversified portfolio of options based on single equities that are selected through a systematic process based on quantitative factor models. The portfolio construction shall ensure that the overall risk exposures remains within predefined boundaries and individual risks are well diversified.
