Definitions

NAV Net Asset Value of a fund's assets less its liabilities per Share.

Correlation measures the strength and direction of the relationship between movements in fund and benchmark returns. A correlation of 1.00 indicates that fund and benchmark returns move in lockstep in the same direction.

Alpha (%) a measure of excess return generated by a manager compared to the benchmark. An alpha of 1.00 indicates that a fund has outperformed its benchmark by 1%.

Beta measures a fund's sensitivity to market movements (as represented by the fund's benchmark). A beta of 1.10 suggests the fund could perform 10% better than the benchmark in up markets and 10% worse in down markets, assuming all other factors remain constant. Usually the higher betas represent riskier investments.

Annualised volatility (%) measures the extent to which returns vary up and down over a given period.

Sharpe ratio performance of an investment adjusting for the amount of risk taken (compared a risk-free investment). The higher the Sharpe ratio the better the returns compared to the risk taken.

Tracking error (%) measures how much a fund's returns deviate from those of the benchmark. The lower the number the closer the fund's historic performance has followed its benchmark.

Information ratio measures if a manager is outperforming or underperforming the benchmark and accounts for the risk taken to

achieve the returns. A manager who outperforms a benchmark by 2% p.a. will have a higher IR than a manager with the same outperformance but who takes more risk.
